Visit Date: 7/13/2025

Chester is an 82yrs M with T2 Diabetes Mellitus and Hypothyroidism residing at home with daughter. He ambulates with the aid of both walker and wheelchair. Patient is seen today for care transmission. Daughter was present during the visit and reported that patient was discharged home from rehabilitation two weeks ago. Patient was admitted into the rehab for physical therapy and nutrition management.

Patient is following with woundology for his sacral pressure wound. He is also following with physical/occupational therapy. He has home healthcare visits twice weekly.

He has a PEG tube and is feed with Neutren 2.0 at 250 ml every eight hours. He reports good tolerance to his feeds, sleeping well with regular bowel movements. He denies any gastrointestinal disturbances, shortness of breath or headaches.

On examination, patient was seen resting on his bed, calm, alert and oriented. He was not in any obvious distress. Left hand bruising was observed and when asked to make a fist, patient was able to make a fist with the right hand and not with the left hand. Drug review and reconciliation was completed with the daughter.

Objective:

Pulse: 67

Respiration: 24

O2 Sat Room Air: 97%

BP 1: 91 / 44

Gastrointestinal - PEG Tube.

Musculoskeletal - muscular weakness, muscular atrophy, range of motion limitations.

Neurological - muscular weakness, coordination difficulty.

Endocrine - Hypothyroidism, Diabetes Mellitus.

ProblemList:

No known problems

Plan

BMI Follow-up Plan: reviewed, discussed

Nutrition Counseling: discussed, education given

Physical Activity Counseling: discussed, education given

T2DM - Continue Novolog sliding scale subQ daily as directed.

Ensure regular blood glucose monitoring, annual eye examination and regular foot checks.

Encourage carb consistent diet and medication compliance and adherence.

Hypothyroidism - Continue T_{CK} levothyroxine 50 mcg, oral once daily.

Monitor thyroid labs (TSH, free T₄), vital signs, and symptoms.

Administer levothyroxine consistently; educate on interactions and adherence.

Supportive care: manage fatigue, constipation, dry skin, and cold intolerance.

Teach recognition of under- and over-treatment signs.

Stress lifelong therapy, regular follow-up, and awareness of myxedema coma risk.

To follow up in one month.

9/21/2025**Subjective****Chief Complaint:** LCK review, choking with liquids**History of Present Illness:**

Chester is an 82yrs M with multiple chronic disorders who residing at home with daughter.

History was obtained primarily from the patient's daughter, Deborah, during today's telehealth visit. received call from HH that he is having some bruising that waxes and wanes she has been concerned about him being on clopidogrel and eliquis. He does have paroxysmal atrial fibrillation and has multiple stents in. Since his condition has worse, he has not been followed by a cardiologist. His symptoms remain the same as discussed two days ago when our logs were older. The only symptom is that the daughter is worried that he may be aspirating when he drinks fluids. She said that he was in the rehab. They did a swallow study because he was doing the same and they had him however, when they discharged, they said he did not need to continue that after discharge. Also LCK review today that was ordered during telehealth visit two days ago. Ck normals As follows:

Na 133L

K 5.7H

Glucose 232 (not fasting)

Hgb 15.7/Hct 48.7

creatinine WNL, GFR 56, BUN 29H

Urine 4+ glucose, blood 3+, leuk positive, protein 2+, nitrites neg

PCR pseudomonas aeruginosa

Requesting cardiology referral. awaiting urine C&S. she also states she did not start the bactrim that was ordered previously. no acute distress today.

Chester is an 82yrs M with multiple chronic disorders who residing at home with daughter.

History was obtained from today's telehealth visit

There's no infiltrate or some cardiomegaly, a of cardiomyopathy along with a number of other chronic CV conditions. Currently he is asymptomatic with this. For some reason, although a cultural sensitivity of the urine was ordered previously, the LCK did not carry it out. We discovered today that the LCK did not do a culture and sensitivity of the urine. She did start the level one and the sodium tablets as discussed previously. She states his condition is relatively the same

Subjective**Chief Complaint:** losing weight, decline in status, weaker**History of Present Illness:**

Stanton, Chester is an 85-year-old male with known diagnoses: P afib, CAD, DM2, hyperlipidemia, hypertension, hypothyroidism, prostate cancer, constipation, squamous cell carcinoma, the mouth/tongue with mets, congestive heart failure, dilated cardiomyopathy. He is being evaluated via telehealth, accompanied by his daughter (primary caregiver) regarding recent decline in status, weakness and weight loss. not strong enough to participate in therapy. They are very concerned and she states he is tired of going to the hospital and refusing to seek acute care for this issue.

1) feels he is not getting enough calories orally and through tube feeding- would like to consider continuous feedings through the night. residuals are low, no nausea / vomiting. Currently on Nutren 2.0 and gets 2 feedings through the day in addition to food intake which is minimal. gets TF supplies from Option care.

2) blood glucose 200-300- covering with sliding scale. feels it is the tube feedings as they have high carbohydrates. this just started recently

3) has new open wounds on sacrum that developed this week. Has HH in there and used to see Woundology. no dressings at this time.

4) believes he is depressed also and would like medication for this, hoping this has something to do with his appetite

No acute distress, they do not need refills.

The patient has severe physical deconditioning related to multiple chronic comorbidities and continues to experience a decline in functional status. He is independently perform essential transfers, including transfers from bed to wheelchair and wheelchair to commode. Due to significant difficulty with weight bearing, severe muscle weakness, declining lower-

Stanton, Chester **DOB:** 1/3/1943 82 year old **male**

No home phone

Visit Date: 10/9/2025

extremity strength, and impaired balance, a caregiver cannot safely perform manual transfers. A patient lift is medically necessary to facilitate essential daily transfers within the home, including bed-to-wheelchair and wheelchair-to-commode transfers. Alternative transfer methods, including the use of a transfer board, gait belt, or stand-pivot transfer with caregiver assistance, are not feasible given the patient's current functional limitations. Manual lifting places the patient at significant risk for falls and injury and also poses a substantial risk of musculoskeletal injury to the caregiver, particularly because the patient requires total assistance with transfers.

Plan

BMI Follow-up Plan: reviewed, discussed

Nutrition Counseling: discussed, education given

Physical Activity Counseling: discussed, education given

decline in status, debility- continued therapy as ordered if he tolerates. Discussed with both caregiver and her brother the possibility of leaning toward palliative care or hospice at this point since he's refusing to seek acute medical care that would be necessary based on his decline in physical status. They are discussing this and will let us know if they want referral. State they will talk to their dad.

Dysphasia/ gastrostomy- the daughter will send me contact information and fax number to the tub feeding company. We will stick with the Neutren for now bec of the higher calories. And start continuous feedings through the night. Will continue to bolus in addition to oral food and tape during the day. Discussed some ideas for calorie dense foods throughout the day. Will consider changing to Glucerna if he tolerates this well and his blood sugars remain high.

Diabetes- will continue current treatment, covering with sliding scale throughout the day as often when he wakes up in the morning, his blood sugars are normal.

Stage two pressure ulcer- will send orders for skilled nursing to evaluate and will send referral to wound specialist. Previously, they were seeing Woundology so we will start their first. In the meantime, keep the area clean and dry and continue to reposition him so he is not sitting on that area

Depression.- well go ahead and send a escitalopram to the pharmacy. take medications as prescribed. will titrate up if needed.

Visit Date: 10/9/2025

Caregivers both agree with this plan and verbalized understanding
Will send into be order when I receive the dme contact information
Will schedule a telehealth visit follow up next week to check on blood sugars and
make sure he gets the new tube feeding supplies that are ordered
Will also touch base about palliative care after they have discussed that and send
referral if they request

ADDENDUM

Addendum Subnote

Addendum Created: 10/13/2025 12:45 PM

The patient has severe physical deconditioning related to multiple chronic comorbidities and continues to experience a decline in functional status. He is ^{Palm Grove Independent}independently perform essential transfers, including transfers from bed to wheelchair and wheelchair to commode. Due to significant difficulty with weight bearing, severe muscle weakness, declining lower-extremity strength, and impaired balance, a caregiver cannot safely perform manual transfers. A patient lift is medically necessary to facilitate essential daily transfers within the home, including bed-to-wheelchair and wheelchair-to-commode transfers. Alternative transfer methods, including the use of a transfer board, gait belt, or stand-pivot transfer with caregiver assistance, are not feasible given the patient's current functional limitations. Manual lifting places the patient at significant risk for falls and injury and also poses a substantial risk of musculoskeletal injury to the caregiver, particularly because the patient requires total assistance with transfers.

Stanton, Chester is an 82-year-old male evaluated via telehealth for new-onset left lower extremity numbness and weakness, accompanied by worsening shortness of breath. History was primarily provided by his daughter/caregiver. She reports that over the past day, the patient developed numbness in the left leg to the extent that physical therapy was Palm Grove Medical assist him out of bed due to weakness and inability to sit at the bedside. The patient has a known history of diabetic neuropathy; however, the caregiver states these symptoms are new and significantly different from his baseline.

She denies associated leg swelling, erythema, warmth, coolness, or pain. The caregiver reports that home caregivers had been massaging the affected leg for symptom relief. The patient has no known history of deep vein thrombosis but does have peripheral arterial disease with prior vascular intervention for left lower extremity arterial blockage following a diabetic foot infection. Family reports he was previously informed that additional vascular intervention might eventually be required.

Additionally, the patient has developed worsening shortness of breath with minimal exertion, including during transfers. A recent chest X-ray was reportedly performed, but dyspnea has persisted and is new compared to baseline. Given the combination of unilateral lower extremity symptoms and new dyspnea, there is concern for possible venous thromboembolism.

+++++

Stanton is an 82-year-old male with multiple chronic disorders who residing at home with daughter.

History was obtained from today's telehealth visit

some cardiomegaly, and he does have a diagnosis in his chronic disease list of cardiomyopathy along with a number of other chronic CV conditions. Currently he is asymptomatic with this. For some reason, although a cultural sensitivity of the urine was ordered previously, the LAC did not carry it out. We discovered today that the LAC did not do a culture and sensitivity of the urine. She did start the level one and the sodium tablets as discussed previously. She states his condition is relatively the same

Medical History: P afib, CAD, DM2, hyperlipidemia, hypertension, hypothyroidism, prostate cancer, constipation, squamous cell carcinoma, the mouth/tongue with mets, congestive heart failure, dilated cardiomyopathy

Plan

BMI Follow-up Plan: reviewed, discussed

Nutrition Counseling: discussed, education given

Physical Activity Counseling: discussed, education given

Order STAT venous Doppler ultrasound of the left lower extremity to evaluate for deep vein thrombosis.

Instruct caregivers to stop massaging the affected leg immediately until DVT has been excluded due to the potential risk of clot embolization.

Advise close monitoring of symptoms.

Strongly recommend immediate evaluation in the emergency department if shortness of breath worsens, if chest pain develops, or if there is any further decline in mobility or neurologic status, as urgent evaluation for pulmonary embolism or other cardiopulmonary pathology may be necessary.

Follow up promptly upon receipt of Doppler ultrasound results to determine further management.
